5,200 New Tool & Software Discovery Candidates

Generated 2026-10-16T19:44:27+00:00 (UTC)

5,200 candidate repositories discovered and screened against **2,159 current directory listings** from the main-branch data/tools.json. Candidate selection emphasizes public repositories with at least five stars, no fork/archive flag, and recent push activity.

Fields included

Name, repository description, inferred discovery category, GitHub URL, declared homepage when supplied, stars, primary language, GitHub-reported license metadata, created/updated/pushed dates, open issues, repository topics, and the search topic that surfaced the project.

Deduplication and accuracy boundaries

The exclusion check uses normalized tool IDs/names, GitHub URLs, homepage URLs and non-generic homepage hosts from the current main-branch catalog. This removes straightforward duplicates; it cannot prove semantic uniqueness. A repo may be a plugin or an adjacent project under a different name, so human review is still required.

Open-source / safety caution

A public GitHub repository is not automatically open source. The License column reflects GitHub's reported metadata or explicitly notes that none was detected. Verify the LICENSE file, current activity, permissions, supply-chain posture, official docs and any managed-service costs before adopting a candidate. Stars are popularity signals, not security audits.
